n8n with PostgreSQL and Worker

Starts n8n with PostgreSQL as database, and the Worker as a separate container.

Start

To start n8n simply start docker-compose by executing the following command in the current folder.

IMPORTANT: But before you do that change the default users and passwords in the `.env` file!

```
docker-compose up -d
```

To stop it execute:

```
docker-compose stop
```

Configuration

The default name of the database, user and password for PostgreSQL can be changed in the [.env](#) file in the current directory.
